

A

AAD

A – Doing the difficult things simply

Of all the many areas considered when trying to qualify ease of use on drives, the one that regularly concerns customers the most is programming – which is undoubtedly the most time consuming and complex operation in drive installation. The A addresses the programming complexity in three ways:

- Simplified optional LED and LCD keypads
- Standardised Solutions software packages
- The facilities provided by the A

Backing up the programming options on the A – and included at no extra cost – is the A. Credit card sized, the A equips the OEM and End User with the flexibility of full plug and play facilities and also a simplified start up.

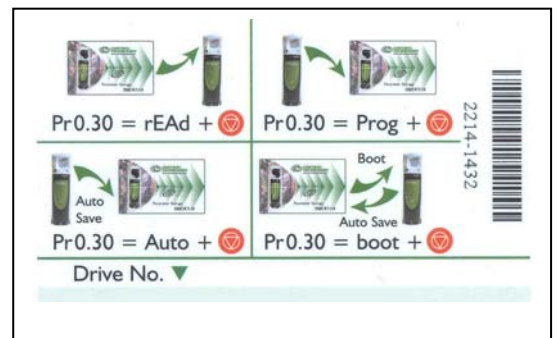

A gives the user the ultimate back-up security, as it rests permanently installed into the drive behind the keypad. In the event of a failure the card can be removed and when the new drive has been installed the A can be inserted into the new drive thereby quickly uploading the complete parameter set - vital for factories with a maximum swap out time (car production lines)

For OEMs with sequential machine production the cloning capabilities of the A can save considerable amounts of time as well as removing the problems of incorrect programming and ‘finger trouble’. Application MACROS can also be uploaded for simple predefined applications such as PID, Brake control etc.

- **Parameter Set up and storage facility – AS STANDARD**
- **Hot Pluggable**
- **Autoback-up of parameters**
- **Fast low cost cloning facility**
- **4 full parameter sets or many sub sets**
- **Pre-defined MACROS**
